KENAN IBRAGIMOV

AI AUTOMATION ENGINEER / N8N DEVELOPER / LOW-CODE DEVELOPER

SUMMARY

Developer with 5+ years of commercial experience. I worked on integrations, analytics and build configuration in game development, then focused on business process automation. I build n8n workflows, write integration scripts in Python and JavaScript, connect services through REST APIs and webhooks, and integrate AI into workflows. I proposed the automation initiatives myself, chose the tools and independently handled implementation, deployment and maintenance, including monitoring and failure diagnosis.

TECHNICAL SKILLS

- n8n, Workflow automation, API integration
- CRM Integration, CRM Automation
- REST API, Webhooks, JSON, GitHub API, ClickUp API, Discord API
- Event-driven integrations, Business process analysis
- Python, JavaScript, SQL, PostgreSQL
- SQL query optimization, Automated testing
- Google Sheets, Google Drive, Google Forms, Google Apps Script
- Telegram bots, Chatbots
- C# / .NET, PowerShell, React, TypeScript
- LLM workflows, RAG, Code retrieval, LangChain, LangGraph
- LLM API integration, OpenAI API, Anthropic API, Gemini API
- OpenRouter, YandexGPT, GigaChat
- Prompt engineering, Context engineering
- System prompts, Tool calling, Structured output
- CLI agents, Codex CLI, Claude Code, Cursor, Gemini CLI, AI code review
- LLM output validation, AI quality evaluation
- AI cost optimization, Latency optimization
- MCP, MCP servers, Hermes Agent, Agent memory
- Skills, Plugins, Obsidian, Knowledge bases
- Git, CI/CD, TeamCity, S3 API, Cloudflare R2
- MLOps basics: AI deployment and monitoring
- Monitoring, logs, retries, webhook diagnostics
- Firebase, Adjust, Facebook, Dashboards
- Technical documentation, Architecture diagrams, Technical specifications
- Technical leadership, Mentoring

PROFESSIONAL EXPERIENCE

Rhinotales **Feb 2025 - Present**

Senior Unity Developer / Build Automation. Critical Shift, a tactical RPG for PC and consoles.

- Proposed and independently implemented n8n workflows connecting ClickUp, GitHub and Discord: PR creation, branch lookup and syncing, task templates and notifications. By my estimate, they saved development departments a combined **2-3 hours** of manual work per day.
- Ran an AI review bot with RAG: retrieved class and method usages, related implementations and project rules. This data enriched the AI context; findings were published in GitHub and Discord. By my estimate, AI review helped reduce bugs by around **20%** and improve code quality.
- Built a gameplay recording tool that used AI to generate C# tests from recorded steps. Reviewed the generated code and scenario replay before using the tests.
- I built a dashboard for builds and build machines: running jobs, the queue, machine health, build start/cancel actions, archives and Steam deployment through TeamCity.
- Proposed and independently developed Automation Hub: a workflow editor and backend, import of the n8n nodes used by our workflows, published versions, run history and configuration tables.
- Used AI and MCP to refine leg IK through scene launches, screenshots and iterative changes. Reviewed intermediate results and accepted the final behaviour.

Stack: n8n, Python, RAG, Code retrieval, Context engineering, Codex CLI, TeamCity, .NET, PostgreSQL

GameFlinker / FlinkStudio **Jan 2021 - Feb 2025**

Unity Developer

Developed gameplay, interfaces and client-server features for mobile projects. Alongside game development, I worked on integrations and internal tools.

- Configured project builds and developed editor tools.
- I built an analytics dashboard using Firebase, Adjust and Facebook data for activity, retention, playtime, progression, monetisation and stability.
- Worked with REST APIs, SignalR and external SDKs.

Stack: Unity, C#, REST API, SignalR, Firebase, Adjust, Facebook

ADDITIONAL INFORMATION

English - B2. Russian and Azerbaijani - native.
